C; Comment: This inhibitor acts as "bait" for tissue plasminogen activator (see PIR:UKHUT C; Comment: This inhibitor acts as "bait" for tissue plasminogen activator (see PIR:UKHUT C; Comment: The concentrations of this protein have been associated with human throm C; Comment: Three types of PAI have been identified (see also PIR:A32853 and PIR:A39339). oma cells. Vascular endothelial cells may be the primary site of synthesis of plasma PAI C; Comment: Glycosylation is not required for inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A;Cross-references: GB:M14083; NID:g189566; PIDN:AAA60008.1; PID:g386997 R;Andreasen, P.A.; Riccio, A.; Welinder, K.G.; Douglas, R.; Sartorio, R.; Nielsen, L.S.; FEBS Lett. 209, 213-218, 1986 A;Title: Plasminogen activator inhibitor type-1: reactive center and amino-terminal hete A;Reference number: A91371; MUID:87080762 A;Accession: A25651

plasminogen activator inhibitor-1 precursor - bovine N; Alternate names: endothelial-cell plasminogen activator inhibitor; PAI-1 C;Specles: Bos prinigenius taurus (cattle) C;Date: 28-Feb-1990 #sequence_revision 22-Apr-1995 #text_change 18-Jun-1999 C;Accession: S06745; A53855; S01324; S10906 R;Mimuro, J.; Sawdey, M.; Hattori, M.; Luskutoff, D.J.
hypothetical protein BB0205 - Lyme disease spirochete C;Species: Borrelia burgdorferi (Lyme disease spirochete) C;Date: 13-Feb-1998 #sequence_revision 13-Feb-1998 #text_change 28-Jul-2000 C;Accession: E70125 R;Fraser, C.M.; Casjens, S.; Huang, W.M.; Sutton, G.G.; Clayton, R.; Lathigra, I son, D.; Peterson, J.; Kerlavage, A.R.; Quackenbush, J.; Salzberg, S.; Hanson, I son, C.; Garland, S.; Fujii, C.; Cotton, M.D.; Horst, K.; Roberts, K.; Hatv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A;Molecule type: protein
A;Molecule type: protein
A;Residues: 24-49, L',51-63 <KAT>
C;Comment: Three types of PAI have been identified. PAI-1 is an acid-stable glycoprot
may be the primary site of synthesis of plasma PAI.
C;Comment: This inhibitor acts as "bait" for tissue plasminogen activator, urokinase,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A; Molecule type: mRNA

A;Description: electron transfer
C;Superfamily: cytochrome b5; cytochrome b5 core homology
C;Superfamily: cytochrome b5; cytochrome b5 core homology
C;Keywords: electron transfer; heme; iron; metalloprotein; transmembrane protein
F;2-77/Domain: cytochrome b5 core homology <CB5>
F;102-118/Domain: transmembrane #status predicted <TMM>
F;37,61/Binding site: heme iron (His) (axial ligands) #status predicted

*Cloning and sequencing of a chromosomal fragment from Clostridium acetobutylicum strain ABKn8 conferring chemical damaging agents and UV resistance to E. coll recA strains. ";

*Curr. Microbiol. 29:229-235(1994).

-I- FUNCTION: NOT KNOWN; COULD CONFER METHYL METHANE SULFONATE (MM: MITOMYCIN C (MC), AND UV RESISTANCE.

-I- SIMILARITY: BELONGS TO THE CAPAB / TERDEXZ FAMILY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                            Score

AAR07245
The sequence represents AAs 1-380 of the PAI-1 protein chain. To The mutant was obtd. by site directed mutagenesis of the wild type gene. It has an Arg at posn. 350 replacing the Glu residue which is thought to form a contact with the t-PA Arg residue at posn. 304. The binding is modelled on that of the complex formed between trypsin and BPI where the Ty-39 of trypsin forms a Van der Waal's contact with Ile19 of BPI. In the mutant the Glu residue has been replaced by and Arg residue, restoring the electrostatic interaction that was disrupted by the construction of the Arg304-> Complementary to the mutant t-PA. The mutant serpin mutant is therefore active inhibtor than its parent protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptides AAVIB12-14 exemplify the peptide of the invention, which is used in a peptide composition to affect a characterized by abnormal cell migration through a physiological barrier, to inhibit pAI-1-dependent adhesion of a cell to a tissue, to promote clearance of scuph from the surface of a mammalian cell, and to impede pathological migration of a cell in a mammal. The composition can be used to affect a biological process characterized by abnormal cell migration through a physiological barrier, where the process is selected from angiogenesis, organogenesis, ovulation, inflammation, cancer, tumor cell angiogenesis, organogenesis, ovulation, inflammation, cancer, tumor cell
                                                                                                                                                                                                                                                                                                                                                                                                Serine protease mutant of the chymotrypsin super-family - compsn. including it and genes encoding it, resistant to inhibition by PAI-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sambrook JF,

                                                                       This PAI-1 mutant has Glu 350 of wild-type mature PAI-1 substituted by Arg. This substitution was chosen to selectively alter the negatively-charged Glu residue to a positively-charged Arg residue and promote potential interactions with the negatively charged Glu 304 residue in the PAI-1-resistant tPA mutant tPA(Glu304) (see AAR23804). The mutant tPAI-1 showed an increased rate constant of interaction with tPA(Glu304) c.f. wild-type PAI-1. The sequence given as AAR23813 does not appear in the specification but has been compiled from the known PAI-1 sequence (see WO9013648) and the description given in the specification.
                                                                                                                                                                                                                              New zymogen plasminogen activator mutants - inhibition by cognate serpin inhibitors in for myocardial infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tissue plasminogen activator; mutant; serine protease; zymogen-like; PAI-1; plasminogen activator inhibitor; coagulation; chymotrypsin superfamily.

                                                                                                                                                                                                         This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used forthe production of antibodies.

The nucleic acids and proteins can be used as targets for anti-fungal compounds to prevent fungal corn infection and the nucleic acids can be used in gene therapy to alter the biosynthetic pathway for the peptide toxins to lower the pathogenicity of the fungi.
                                                                                                                                                                                                                                                                           Claim 24; Page 39; 132pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides the primary nucleotide sequence of the WSBV genome (AAH62689), predicted transcript sequences (AAH62689) And encoded proteins (AAA68491)—AAG85051) and oligonucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp.

The invention relates to lysine and histidine-specific transporter CC (LITH), proline transporter and their corresponding cDNA clones. It is useful for producing transgenic plants with altered expression level of camino acid transporters, in cell types or developmental stages in which corresponding transporters, and the obtained transgenic plants of they are not normally found, such that the obtained transgenic plants companies to salt and water stress. The level of lysine, in its invention is also used for constructing a chimeric gene encoding all corresponding to the amino acid transporter, where in the expression of chimeric gene results in the production of altered levels of amino acid transporter in a transformed host cell. Synthetic peptides obtained from the corresponding transporter are used for immunising animals to produce polyclonal or monoclonal antibodies, which facilitates the immunological excreening of cDNA expression libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The coding sequence is of sufficient length to allow hybridisation under standard hybridisation conditions to a S. pneumoniae cps gene flanking region and may be used in methods to detect and serotype S. pneumoniae. It may also be used for the diagnosis and prevention of
                                                                                                                                                                                                                                                                                                                                                                                                infection; bacterial capsule; serotype specific; virulence; diagnosis; capsule synthesis; cassette model; binary model; cassetting-in; flanking region; non-serotype specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Streptococcus pneumoniae capsular polysaccharide genes for detection, serotyping and for diagnosis and prevention pneumoniae infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC functions of capsule synthesis and hence determine the particular CC structure of the capsule polysaccharides produced. Therefore cps genes CC determine the serotype of the virus.

CC AR211799, AR211800, AR211801 and AR211802) may be used in hybridization CC aR211799, AR211800, AR211801 and AR211802) may be used in hybridization CC assays to identify the location of DNA flanking serotype-specific cps CC deditionally, the flanking regions are involved in recombination CC and integration of the type specific cps genes during virus CC and integration of the type specific cps genes during virus CC excrype-specific cps genes) is integrated between the nucleic acids CC of the flanking region, the resulting construct can be stably integrated CC miss allows the locus of the serotype-specific can be stably integrated CC isolated and characterized. The cps gene sequences may then be used as CC hybridization probes to identify and quantify specific serotypes of S. CC pneumoniae or to recombinantly produce the gene products for use as axis control of the municipal control of the serotypes of S. CC antigens in immunization protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAX54537 to AAX54576 and AAZ54616 to AAZ54373 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ54573 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                               The amino acid sequence is that 6 which was translated from DNA AAR21409-R21413 and AAR20056.
                                                                                                                                          New DNA sequences which act assaying DNA sample from reinfected with P carinii
                                                                                                      Claim 3; Fig 3; 42pp; English
                                                                                                                                                                                                                N-PSDB; AAQ20065.

                                                                                                                                                                                                               This invention describes novel isolated Streptococcus pneumoniae polynucleotides (see AA796173-296494) and their encoded proteins (see C Polynucleotides (see DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of such a polypeptide. They can also be used to expression or activity of interact with and inhibit or activate such a polypeptide. The polypeptides (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of infection, dysfunction and disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local

                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Streptococcus pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a polypeptide of the thymidylate kinase family (tdk polypeptides), and is derived from Streptococcus pneumoniae. Tdk polynucleotides may be used to recombinantly produce the tdk polypeptides either in vivo (e.g. as part of a genetic vaccination procedure) or in vitro (e.g. as part of a fermentation culture). The nucleic acids and proteins may be used to diagnose diseases in which the tdk polypeptides are expressed, such as infection by

This sequence represents a Streptococcus pneumoniae protein of the CC invention. The proteins (or their homologues, derivatives and/or invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or city of the detection or diagnostic of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagonising, inhibiting or interfering with the city of the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions young children, the elderly, and in patients with predisposing conditions or with immunosuppressive disporders, especially AIDS. They can also be used to treat pneumococcal septicaemia, otilis media, sinusitis, and
